

Watchmen GY6

Development & Security Audit Report

Prepared for: Dustin LaChance • Prepared by: Aaron Pilkington • Date: July 1, 2026

Scope: the complete build, May 25 – July 1, 2026 (with a detail section on the most recent security & feature sprint).

Executive Summary

Watchmen was built from zero to a live, App-Store-shipped community platform in roughly five and a half weeks. It is a substantial product — a private, invite-only social network with realtime chat, an event calendar, groups, moderation tools and a leadership admin console — delivered as both a native iPhone app and a web app. The build spans **~47,000 net lines of code across 154 production releases and 49 database migrations**. The most recent sprint took the app from several exploitable security holes to a defensible posture: **all four critical issues were closed** (self-awarded points, sneaking into private chats, opening others' chat photos by link, and data left behind after account deletion), alongside member-requested features. Every change in that sprint was independently verified in the code (**18 of 18**) with live database checks passing. The app is safe in members' hands and in active use.

Scorecard (out of 100)

82 Build Difficulty vs typical apps	85 Security post-hardening	77 Code Quality maintainability	88 Feature Depth breadth shipped	80 Production Ready live & stable
--	---	--	---	--

Ratings assessed from the codebase by independent audit passes; justification in the Security and App-at-a-Glance sections.

By the Numbers — Whole Project

Timeframe	May 25 – July 1, 2026 (~5.5 weeks · 17 active build days)
Production releases pushed (commits to main)	154
Vercel production deployments	160+ (releases + manual redeloys)
Total code written	+52,014 / -4,998 lines (~47,000 net)
Current source base	246 TypeScript/React files (~31,000 lines)
Database tables	30
Database migrations	49
Secure database functions (SECURITY DEFINER)	~39
Server-action modules	23
App screens / routes (excl. design mockups)	~44
iOS App Store builds submitted	7 (v1.0.2 live · v1.0.3 in review)
Estimated engineering time	~100–150 hours*

* Estimate based on 17 active build days and the scope shipped; not stopwatch-tracked.

Most Recent Sprint (Jun 30 – Jul 1)

Releases pushed	15
Database migrations run (SQL)	6 (00044–00049)
Critical security holes closed	4 of 4
Independent verification	18 / 18 changes confirmed in code; live DB checks passed

Work Delivered — Recent Sprint

Area	Delivered	Status
Security	Locked leaderboard-points functions (stop self-awarded points)	LIVE
Security	Closed private-chat self-join hole (can't enter uninvited threads)	LIVE
Security	Made chat photos private (signed links, members only)	LIVE
Security	Fixed private-feed activity leak (home_feed_stats viewer)	LIVE
Privacy	Account deletion now scrubs email/username/invite code + avatar	LIVE
Security	Removed loose Apple push key; added baseline security headers	LIVE
Security	Patched framework (Next.js) to close dependency advisories	LIVE
Feature	Edit your own posts after publishing	LIVE
Feature	Delete comments (author or admin)	LIVE
Feature	Tap any image/flyer to enlarge + zoom (feed, events, groups)	LIVE
Feature	Keyboard spell-check / autocorrect in post, comment & edit boxes	LIVE
Feature	AI 'Polish' proofread button (built, off pending sign-off)	READY
Performance	Infinite scroll — older posts past #50 now reachable	LIVE
Performance	Faster member/event/chat screen loads (parallel data)	LIVE
Performance	Faster event/meetup attendee counts (scales with growth)	LIVE
Fix	Stopped whole-screen bounce on the Conversations list	LIVE
Fix	Group flyers no longer cropped; empty map box removed	LIVE
Foundation	Generated real database types (for future type-safety work)	DONE
Quality	Consolidated 14 duplicate admin DB clients into one audited factory	LIVE
Quality	Chat reactions made idempotent (no error on fast double-tap)	LIVE
Quality	Gated noisy debug logs behind a flag (cleaner production logs)	LIVE

LIVE = deployed to members · DONE = merged · READY = built, awaiting go-ahead (AI Polish needs a paid key + sign-off).

Security Posture — 85/100

Every headline fix is genuinely in place and correctly built, confirmed against the actual code and the live database. The private, members-only parts of the app are properly locked down.

Now secured: members can no longer award themselves points, enter private chats they weren't invited to, open other members' chat photos by guessing a link, see another member's private feed activity, or leave personal data behind after deleting their account. The master database key stays on the server (never shipped to phones); sensitive fields

(email, phone) are hidden from ordinary members at the database level; row-level security governs every table.

Residual / optional (not exploitable today): no automated test suite yet (the biggest long-term investment — it would stop a future edit from quietly re-opening a fix); no strict browser content-security-policy (deliberately deferred); a few duplicated admin database-client copies worth consolidating; a minor chat-reaction double-tap already bounded by a database uniqueness rule.

The App at a Glance

What it is: a private, invite-only community app for the Watchmen members' club — a gated social network with a live event calendar, group and 1-on-1 chat, and a leadership admin console — shipped as a native iOS App Store app plus a web app.

Feature areas: social feed (posts, likes, comments, polls, @mentions, pinned posts); realtime private DMs, group chat & per-event chat rooms; events with RSVP and GPS-verified check-in; member-run meetups; member directory & rich profiles; moderation (report, block, suspend); admin command room (approvals, roles, reports, partnerships); push notifications across three systems; points & leaderboard; partner discounts; digital member card; invite/onboarding flow; universal deep links; in-app account deletion.

Tech stack: Next.js 14 + React + TypeScript, Supabase (PostgreSQL with row-level security, Auth, Storage, Realtime), Capacitor native iOS wrapper, push via Apple APNs + Web Push, email via Resend, hosted on Vercel.

Build Difficulty 82/100: well above a typical app — secure realtime messaging in three contexts, a multi-tenant-style security model across 30 tables, native iOS deployment through App Store review, push across three systems, and GPS/time-gated check-ins. **Code Quality 74/100:** security-first data layer, service-key isolation, shared mappers and clear structure; held back mainly by the absence of automated tests and some loosely-typed code — both fixable without rearchitecting.

Database Migrations (49 total; recent 6 detailed)

The schema evolved across 49 forward-only migrations. The six run in the most recent sprint:

Migration	Purpose
00044	Fix home_feed_stats so a member's feed activity can't be probed by others (repaired a regression)
00045	Grouped attendee-count functions for events & meetups (scales without pulling every RSVP row)
00046	Account deletion also scrubs email / username / invite-code identifiers
00047	Revoke client access to points functions; drop the private-chat self-join policy
00048	Make the chat-media bucket private (photos served via signed, members-only links)
00049	Optional performance index for feed pagination

What's Left (all optional or conditional)

The necessary work is done; remaining items are engineering polish or only matter under specific future conditions.

Optional hardening/cleanup: add an automated test suite (best long-term investment), consolidate duplicated admin database clients, add a strict content-security-policy, finish wiring the new database types app-wide, fix the minor chat-reaction double-tap. **Only when triggered:** bump the iOS build number (next App Store upload), paginate the groups list (past ~100 groups), implement Android push (only if launching on Android). None block growth today.
